What is CI?

CI means developers regularly add (integrate) their code into a shared repository (like GitHub), and automated tests run every time.

What is CD?

CD is a practice in software development where code changes are automatically prepared and delivered for release, and can be deployed to production quickly and reliably.

How GitHub Actions Works?

GitHub Actions works by using a workflow file written in YAML where you define what tasks should run. When an event like a push or pull request happens, it automatically triggers the workflow. GitHub then starts a virtual machine (runner) to execute the steps you defined. It performs tasks like testing, building, and deploying your code without manual effort.
